Find a table or shelf near a window during the day and place two similar sized drinking glasses side by side. Be sure that your glasses are the same size and are at least 6 inches tall.

Take a picture from above at a 45 degree angle so you can see both the top and side of the glass. Repeat from the side at a 90 degree angle.

How does the relative size of the opening change?

Go back and look at your pictures from the homework of "Angle of Attack"

What happens to the relative size of the child's head in relationship to their body?

How does angle of attack influence relative sizes of two objects?

Why is it generally unflattering to take a picture of someone from below? (What happens to the shape and size of their body in relationship to their heads?)
